

When we love the earth, we are able to love ourselves more fully. I believe this. The ancestors taught me it was so. -bell hooks

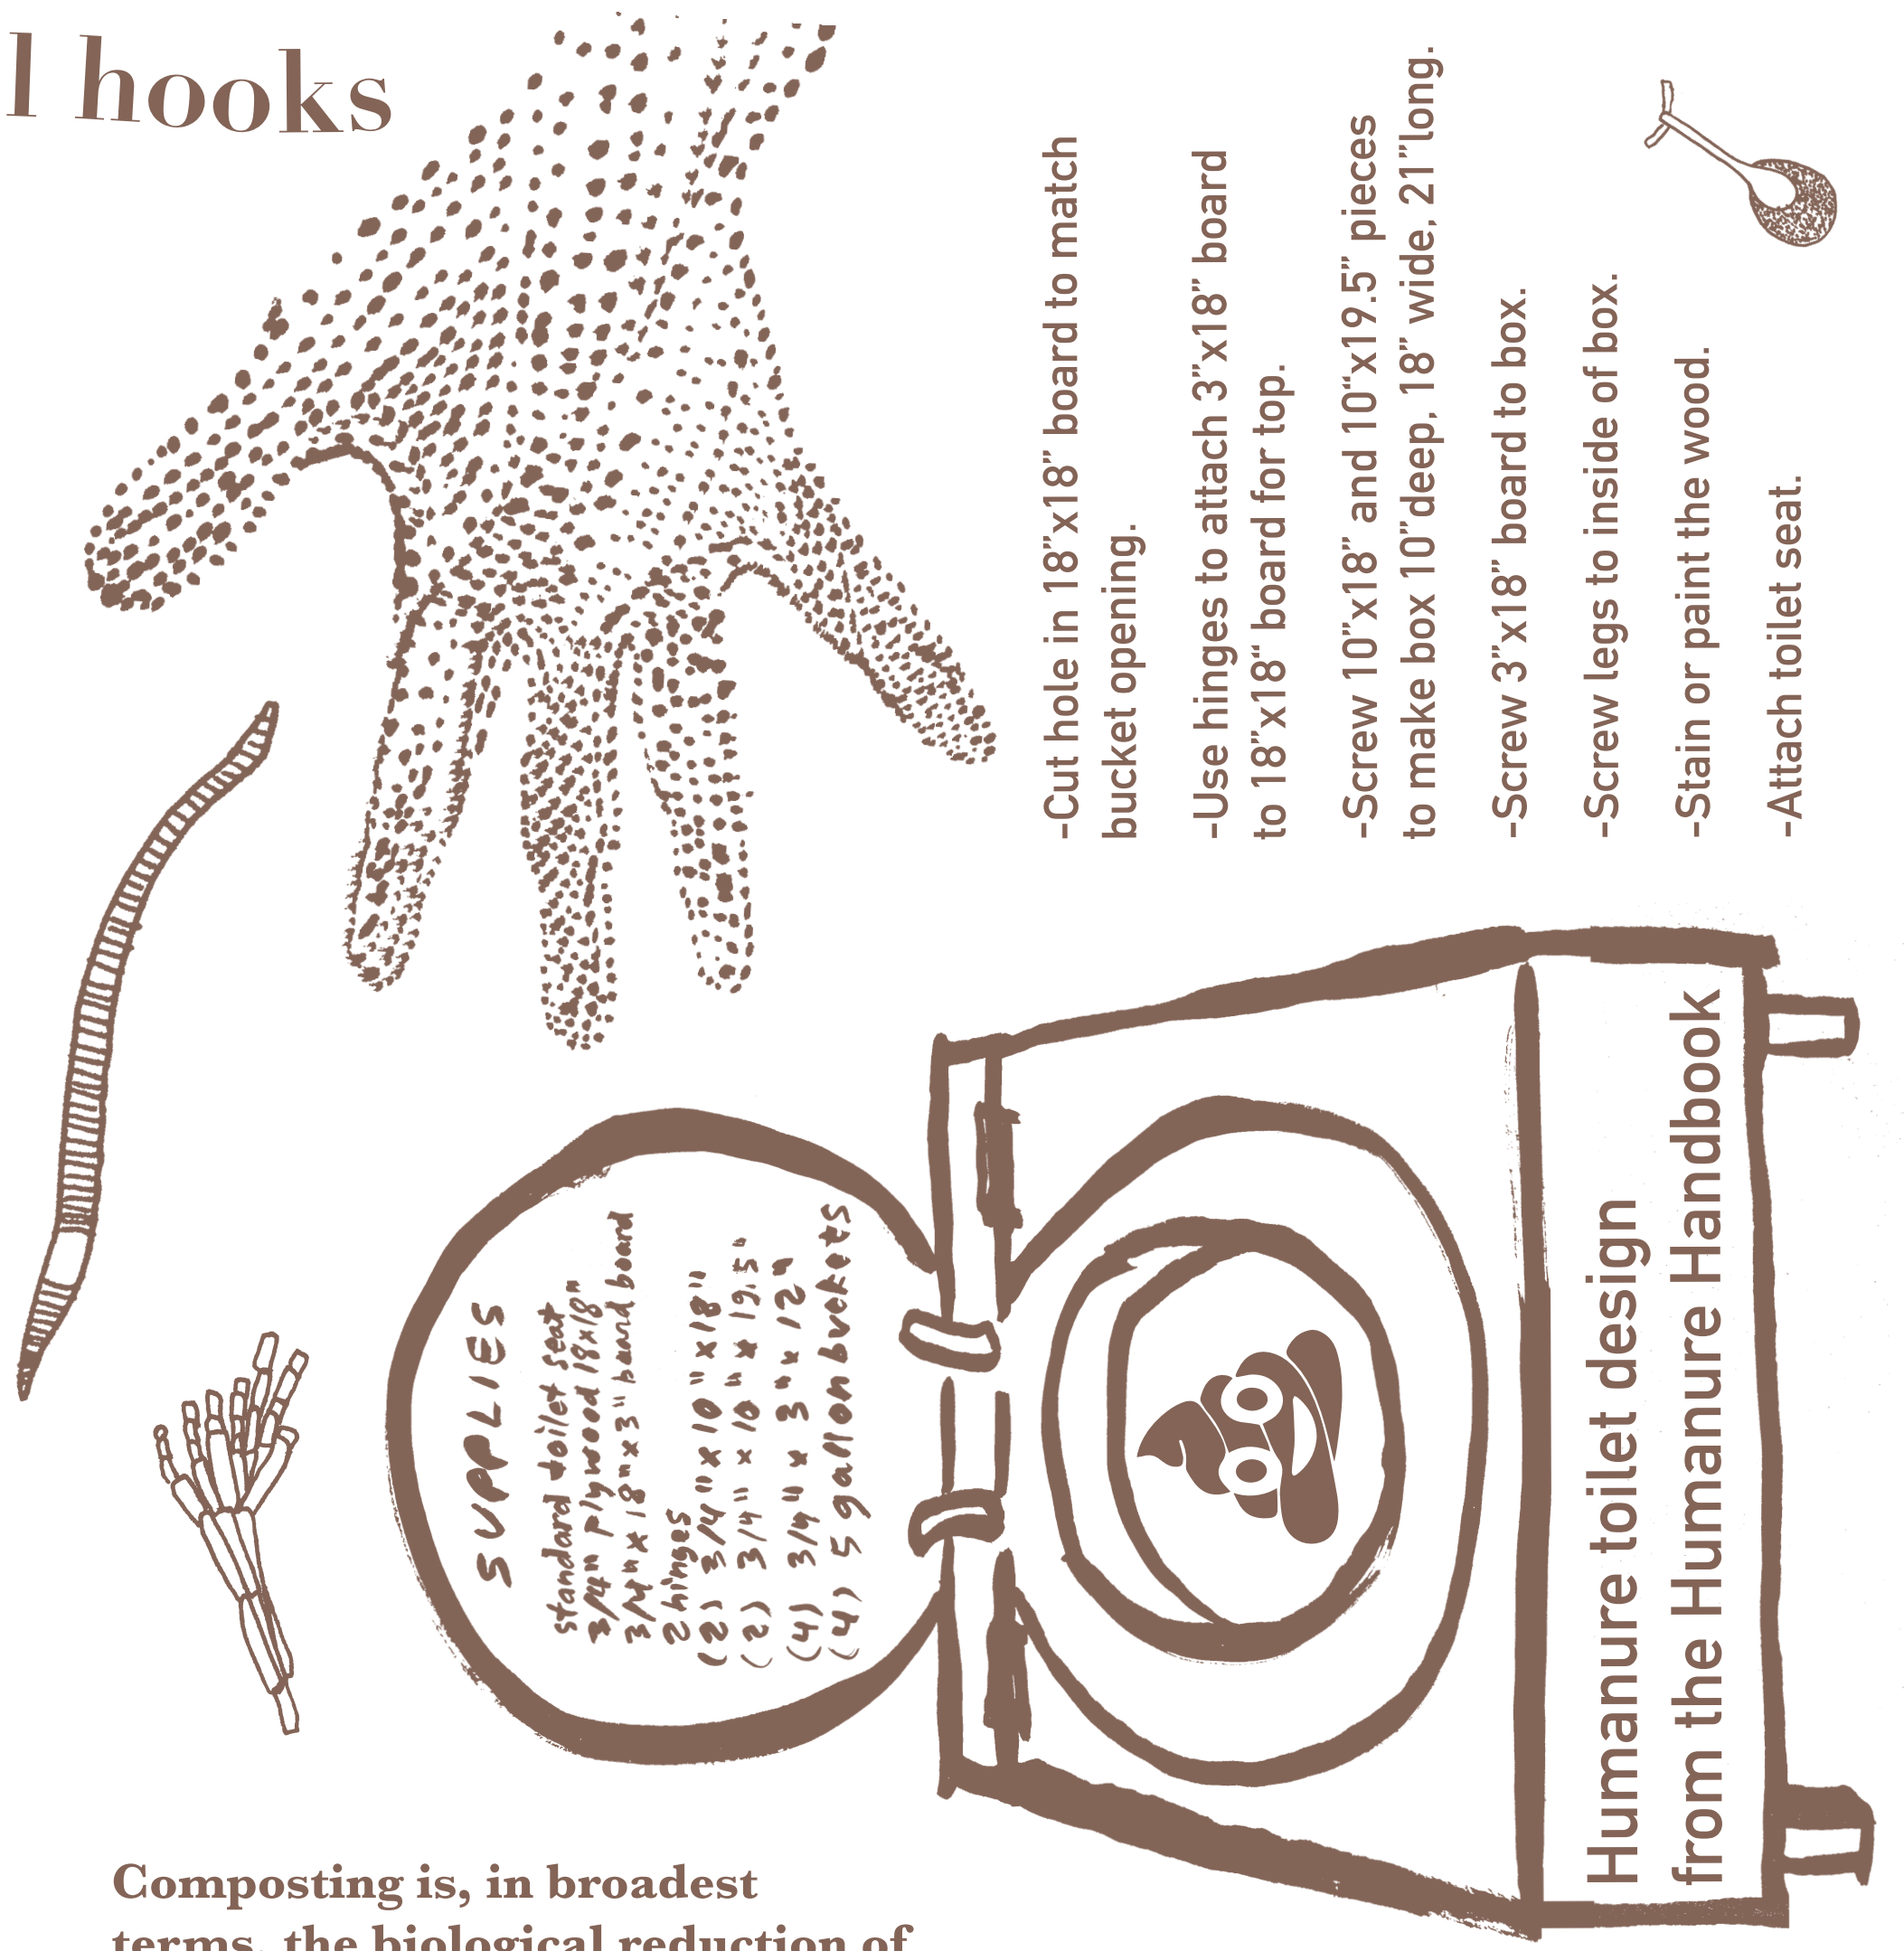

**(HUMAN MANURE) IS HUMAN FECAL MATERIAL & URINE RECYCLED FOR AGRICULTURAL PURPOSES VIA COMPOSTING. HUMANURE CONTAINS VALUABLE SOIL NUTRIENTS THAT ENHANCE PLANT GROWTH.** When discarded into the environment as a waste material, it creates pollution and threatens PUBLIC HEALTH. When recycled by COMPOSTING, the pollution and health threats can be eliminated.

# THE ASPIRATION

IS

# DECOMPOSITION

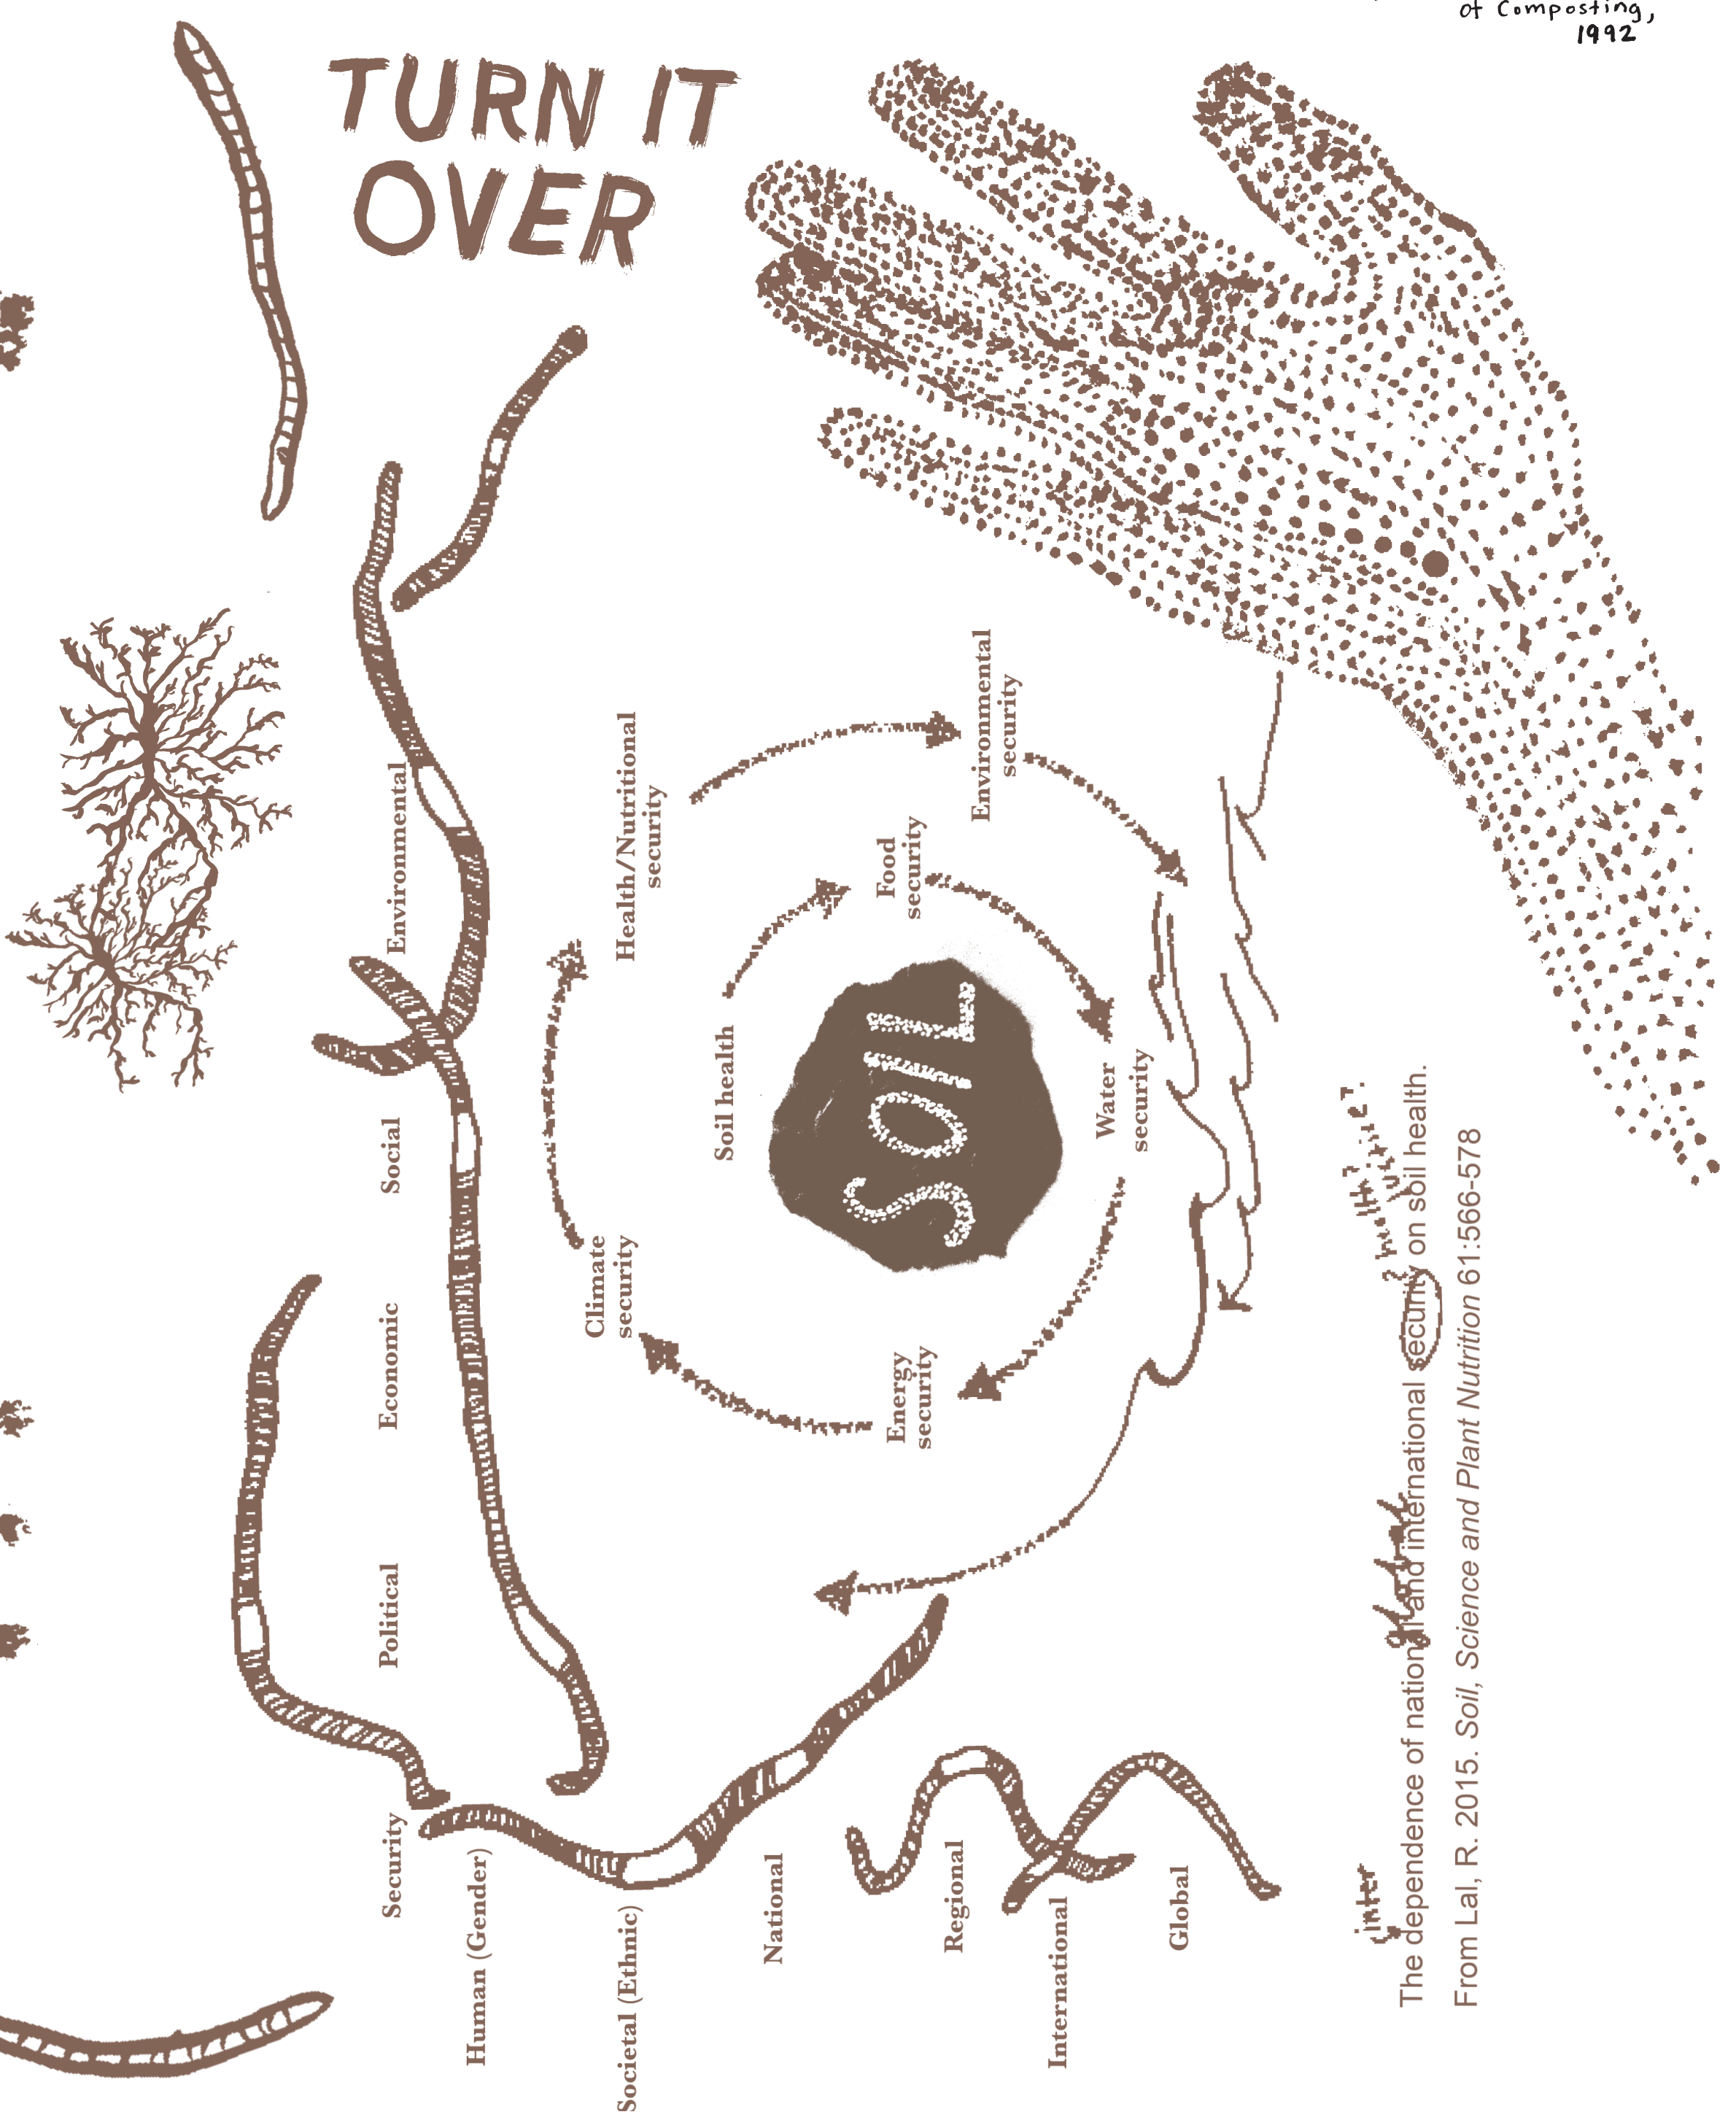

Composting is, in broadest terms, the biological reduction of organic wastes to humus. Whenever a plant or animal dies, its remains are attacked by soil microorganisms and larger soil fauna and are eventually reduced to an earthlike substance that forms a beneficial growing environment for plant roots.

This process, repeated continuously in endless profusion and in every part of the world where plants grow, is part of the ever-recurring natural process that supports all terrestrial life. The entire composting process is difficult to contemplate in its full dimensions. Let's just say that compost and composting are, like water and air, essential of life.

- excerpt from, The Rodale Book of Composting, 1992
